

## 61A Lecture 4

## Announcements

## Iteration Example

## The Fibonacci Sequence

```
def fib(n):  
    """Compute the nth Fibonacci number, for N >= 1."""  
    pred, curr = 0, 1 # 0th and 1st Fibonacci numbers  
    k = 1 # curr is the kth Fibonacci number  
    while k < n:  
        pred, curr = curr, pred + curr  
        k = k + 1  
    return curr
```

The next Fibonacci number is the sum of the current one and its predecessor

## Discussion Question

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377

Is this alternative definition of fib the same or different from the original fib?

```
def fib(n):  
    """Compute the nth Fibonacci number?"""  
    pred, curr = 0, 1 # pred, curr = 1, 0  
    k = 1 # k = 0  
    while k < n:  
        pred, curr = curr, pred + curr  
        k = k + 1  
    return curr
```

I'm still here

(Demo)

## Designing Functions

## Describing Functions

```
def square(x):  
    """Return X * X."""
```

A function's *domain* is the set of all inputs it might possibly take as arguments.

*x is a real number*

```
def fib(n):  
    """Compute the nth Fibonacci number, for N >= 1."""
```

*n is an integer greater than or equal to 1*

A function's *range* is the set of output values it might possibly return.

*returns a non-negative real number*

*returns a Fibonacci number*

A pure function's *behavior* is the relationship it creates between input and output.

*return value is the square of the input*

*return value is the nth Fibonacci number*

## A Guide to Designing Function

Give each function exactly one job, but make it apply to many related situations

```
>>> round(1.23) >>> round(1.23, 1) >>> round(1.23, 0) >>> round(1.23, 5)  
1 1.2 1 1.23
```

Don't repeat yourself (DRY). Implement a process just once, but execute it many times.

(Demo)

## Generalization

## Generalizing Patterns with Arguments

Regular geometric shapes relate length and area.

Finding common structure allows for shared implementation

(Demo)

## Higher-Order Functions

## Generalizing Over Computational Processes

The common structure among functions may be a computational process, rather than a number.

$$\sum_{k=1}^5 k = 1 + 2 + 3 + 4 + 5 = 15$$

$$\sum_{k=1}^5 k^3 = 1^3 + 2^3 + 3^3 + 4^3 + 5^3 = 225$$

$$\sum_{k=1}^5 \frac{8}{(4k-3) \cdot (4k-1)} = \frac{8}{3} + \frac{8}{35} + \frac{8}{99} + \frac{8}{195} + \frac{8}{323} = 3.04$$

(Demo)

## Summation Example

```
def cube(k):
    return pow(k, 3)
def summation(n, term):
    """Sum the first n terms of a sequence.

    >>> summation(5, cube)
    225
    """
    total, k = 0, 1
    while k <= n:
        total, k = total + term(k), k + 1
    return total
```

Function of a single argument (not called "term")

A formal parameter that will be bound to a function

Sum the first n terms of a sequence.

The cube function is passed as an argument value

The function bound to term gets called here

0 + 1 + 8 + 27 + 64 + 125

## Functions as Return Values

(Demo)

## Locally Defined Functions

Functions defined within other function bodies are bound to names in a local frame

```
def make_adder(n):
    """Return a function that takes one argument k and returns k + n.

    >>> add_three = make_adder(3)
    >>> add_three(4)
    7
    """
    def adder(k):
        return k + n
    return adder
```

A function that returns a function

The name add\_three is bound to a function

A def statement within another def statement

Can refer to names in the enclosing function

## Call Expressions as Operator Expressions
